

Lecture 10

To Do List :

```
import React, { useState } from "react";

const TodoReact = () => {
  const [task, setTask] = useState("");
  const [tasks, setTasks] = useState([]);

  const handleAddTask = () => {
    setTasks([...tasks, task]);
    setTask("");
  };

  const handleDelete = (index) => {
    setTasks(tasks.filter((_, i) => i !== index));
  };

  return (
    <div>
      <h1>To do list</h1>

      <input
        type="text"
        placeholder="Enter the task"
        onChange={(e) => setTask(e.target.value)}
      />

      <button onClick={handleAddTask}>Add Task</button>

      <ul>
        {tasks.map((t, index) => (
          <li>
            {t}
            <button onClick={() => handleDelete(index)}>
              Delete Task
            </button>
          </li>
        ))}
      </ul>
    </div>
  );
};
```

```

        ))}
      </ul>
    </div>
  );
};

export default TodoReact;

```

Calculator :

```

import React, { useState } from "react";
import TodoReact from "../todolist";

const Calculator = () => {

  const [input , setInput]=useState("")
  const [result,setResult]=useState("")

  const handleClick=(value)=>{
    setInput(prev => prev + value)
  }
  const handleSubmit=()=>{
    setResult(eval(input))
  }

  return(
    <div>
      <h1>Calculator</h1>
      <h3>{input || 0}</h3>
      <h3>{result || 0}</h3>

      {
        [1,2,3,4,5,6,7,8,9,0,'+', '- ', '* ', '/ ', '='].map(
          (t) => <button onClick={() => (t==='=' ) ?
handleSubmit() : handleClick(t)}>{t}</button>
        )
      }
    </div>
  )
}

```

```
        <button onClick={()=>{
            setInput("")
            setResult("")
        }}>clear</button>
        <TodoReact/>

    </div>
);
}

export default Calculator
```
